**Primary Examiner** 

Art Unit: 3761 6/20/06

Continuation of 11. does NOT place the application in condition for allowance because: Applicant argues that Walter, throughout the disclosure, does not support the Examiner's position that a gas will be within the sheath and remain there until the seal is broken, and that the gas will be sterile, as set forth in the rejection mailed 2/24/06. Applicant points to portions of the Walter disclosure that discuss the bag being collapsed before filling and rid of air, that the bag is taught to not contain air to avoid embolism, and that the invention provides a system that elimiates the liquid-gas interface (see pgs. 3-4 of remarks). However, this discussion is all directed to the bag being void of air. The connector that comprises a needle cannula (16) surrounded by a tubular sheath/diaphragm (17) in Walter is taught to be sealed to provide sterility for the canula and its outlet from bacterial contamination. The sterility is maintained by being sealed, and it is obvious that air (i.e. a gas) will be within the sealed sheath and remain there until the seal is broken and that the air/gas would be sterile. Said cannula is used to pierce a tube at the time of use, thereby releasing the air. This feature is separate from the bag being void of air; the bag being without air to prevent a liquid-gas interface is a separate, unrelated strucural component.
